VirtualDJ plugin to help tango DJs build tandas.

Tiger Tanda identifies the song you're browsing in VirtualDJ, matches it against a curated tango metadata database, and helps you find complementary songs to build a complete tanda.

Features

- **Fuzzy song identification** — automatically detects the song selected in VirtualDJ's browser and fuzzy-matches it against the metadata database
- **Filtered tanda search** — find matching songs filtered by artist, singer, orchestra, genre, grouping, label, track, and year range
- **Smart VDJ browser search** — searches VirtualDJ's browser and scores results by artist, title, year closeness, stars, and play count
- **Cover art** — displays embedded album art from your audio files (MP3, FLAC, AIFF, M4A) in the browse list
- **Prelisten waveform** — preview songs directly from the plugin with a visual waveform
- **Add to playlist** — add songs to VirtualDJ's automix playlist or sidelist directly from the plugin
- **Cross-platform** — Windows (DLL) and macOS (bundle)

Installation

Windows

1. Download `TigerTanda-Windows.zip` from Releases
2. Extract the zip — you'll get `TigerTanda.dll` and `metadata.csv`
3. Copy both files to your VirtualDJ plugins folder:

   ```
   Documents\VirtualDJ\Plugins64\SoundEffect\
   ```

4. Restart VirtualDJ
5. Click one of the Master Effects slots -> click More... -> Select TigerTanda -> Use the '>' button to add.
6. You can now add TigerTanda to an effects slot and open it.

macOS

1. Download `TigerTanda-macOS.zip` from Releases
2. Extract the zip — you'll get `TigerTanda.bundle` and `metadata.csv`
3. Copy both to your VirtualDJ plugins folder:

```
~/Library/Application Support/VirtualDJ/Plugins64/SoundEffect/
```

4. Restart VirtualDJ
5. The Tiger Tanda window appears automatically when VirtualDJ is in the foreground

Usage

Tiger Tanda uses a two-column layout with a Main view and a Settings view, toggled via the gear icon.

Main View

The main view has two columns:

Left column — Identify & Match:

1. **Search row** — title, artist, and year fields auto-populate as you browse songs in VirtualDJ. Use the lock icon to freeze the search fields while you navigate away.
2. **Candidates** — up to 3 fuzzy-matched candidates from the metadata database. Click one to confirm the match and trigger a tanda search.
3. **Matches** — up to 20 songs that pair well with the confirmed track, filtered by your active settings and sorted by year. Double-click a match to search for it in VirtualDJ's browser.

Right column — Browse & Add:

4. **Detail box** — shows detailed metadata for the selected match.
5. **Browse list** — top results from VirtualDJ's browser, scored by how well they match (artist, title, year, stars, play count) and displayed with cover art thumbnails.
6. **Prelisten & Add** — preview a song with the waveform display, then click **ADD** to add it to VirtualDJ's automix playlist (or right-click to add to the sidelist).

Settings View

Toggle the gear icon to open Settings. The left column has search filters, and the right column explains how the plugin works.

Search filters:

- **Artist** — match songs by the same artist
- **Singer** — match songs with the same singer
- **Orchestra** — match songs by the same orchestra
- **Genre** — match songs in the same genre
- **Grouping** — match songs with the same grouping
- **Label** — match songs on the same label
- **Track** — match songs with the same track name
- **Year range** — toggle on/off and adjust the range with +/- buttons (±2, 3, 5, 8, or 10 years)

Filters are combined: only songs matching all active filters appear in results. Settings persist between sessions.

Building from Source

Prerequisites

- CMake 3.22+
- **Windows**: Visual Studio 2019+ with C++ desktop workload
- **macOS**: Xcode command-line tools

Windows

```
cmake -B build -A x64
cmake --build build --config Release
```

Output: `build/Release/TigerTanda.dll` and `build/Release/metadata.csv`

macOS

```
cmake -B build
cmake --build build --config Release
```

Output: `build/TigerTanda.bundle` and `build/metadata.csv`
